DESIGN OF REINFORCED CONCRETE RETAINING WALL

Dr. Zainorizuan Mohd Jaini
Faculty of Civil and Environmental Engineering
Universiti Tun Hussein Onn Malaysia
86400 Parit Raja, Batu Pahat, Johor, Malaysia
Retaining walls are usually built to hold back soil mass. Retaining walls are structures that are constructed to retain soil or any such materials which are unable to stand vertically by themselves.

They are also provided to maintain the grounds at two different levels.

Types of retaining wall:
- Gravity wall
- Cantilever wall
- Counterfort wall
- Buttress wall
- Piling wall (CBP)
- Anchored wall

Design Consideration

- Component:

  Retaining Walls: Reinforced Concrete

  - Steel reinforcement
  - 50mm weep hole @ 1-2m
  - Drainage mat with filter fabric
  - Porous backfill 50mm minimum cover
  - Perforated drainpipe sloped to drain away from the wall 75mm minimum cover
  - Frostline

© 2009, InterNACHI
Design Consideration

- Typical size:
Design Consideration

- Design procedure (cantilever retaining wall):
  - Assume a breath for the base is 0.75 of the wall height. The preliminary thickness for the wall and base section can be assumed.
  - Calculate the horizontal pressure on the wall. Then, considering all forces, check stability against overturning and the vertical pressure under the base of the wall.
Design Consideration

- Calculate and check the resistance to sliding. Use $\gamma_f = 1.4$ to the horizontal loads for the overturning and sliding check. The maximum vertical pressure is calculated using service load and should not exceed safe bearing pressure.
- Reinforced concrete design for the wall is conducted by using the ultimate load. For the wall and earth pressure, use $\gamma_f = 1.4$.
- Surcharge if present may be classed as either dead or imposed load depending on its nature.
- For the wall, calculate shear force and moments caused by the horizontal earth pressure.
- Design the vertical moment steel for the inner face and check the shear stresses.
Design Consideration

- Minimum secondary steel is provided in the horizontal direction for the inner face and both vertically and horizontally for the outer face.
- The net moment due to earth pressure on the top and bottom faces of the inner footing causes tension in the top and reinforcement is designed for this position.
- The moment due to earth pressure causes tension in the bottom face of the outer footing.
Earth Pressure

Mass of wall acts downward

Passive earth pressure in front of wall

Active earth pressure behind wall – wedge or retained earth plus any hydrostatic pressure

Ground pressure (passive) or subsoil reaction
Earth Pressure

- Active soil pressure:
  - Two cases known as cohesionless soil such as sand and cohesive soil such as clay.
  - The active soil pressure is due to the level of backfill.
  - If there is a surcharge of $w \text{kN/m}^2$ on the soil behind the wall, this is equivalent to an additional soil depth of

$$z = \frac{w}{\gamma}$$

where:
- $w$ is surcharge in kN/m$^2$
- $\gamma$ is the density of soil in kN/m$^3$
Earth Pressure

- For cohesionless soil \((c = 0)\), the pressure at any depth, \(z\) is given by:

\[
\rho = \gamma z \frac{1 - \sin \varphi}{1 + \sin \varphi}
\]

where: \(\gamma\) is the density of soil and \(\varphi\) is the friction angle. Meanwhile, the force on the wall of height \(H_1\) is:

\[
P_1 = 0.5\gamma H_1^2 \frac{1 - \sin \varphi}{1 + \sin \varphi}
\]

- For cohesive soil \((\varphi = 0)\), the pressure at any depth, \(z\) is given by:

\[
\rho = (\gamma z) - 2c
\]

This expression gives negative value near top of the wall. In practice, a value for the active soil pressure is \(< 0.25\gamma z\).
Earth Pressure

- Vertical pressure under the base:
  - The vertical pressure under the base in calculated for the service load.
  - For a cantilever wall, 1m length of wall with based width $b$ is consider; then the area and modulus of section area:
    \[ A = b \times 1 \text{ m} = b \text{ m}^2 \quad ; \quad Z = b^2 / 6 \text{ m}^3 \]
  - The sum of the moment of all vertical forces about the center of the base and active pressure on the wall is:
    \[ \sum M = \sum W ( x - b / 2 ) - P_1 ( H_1 / 3 ) \]
  - The passive earth pressure in front of the base has been neglected. The maximum pressure is:
    \[ P_{\text{max}} = \frac{\sum W}{A} \pm \frac{\sum M}{Z} \]

This should not exceed the safe bearing pressure on the soil.
Stability

- **Wall stability**
  - The vertical loads are made up of the weight of the wall and base, and the weight of the backfill on the base. Front fill on the outer base can be neglected.
  - Surcharge would need to be included if present.
  - The critical condition for overturning is when a maximum horizontal force acts with minimum vertical load.

*Excessive settlement may occur if weak soil layer is located below the foundation within 1.5 times foundation width*
Stability

− To guard against failure by overturning, it is usual to apply conservative factors of safety to the force and loads.
− If the centre of gravity of these loads is $x$ from the toe of the wall, the stabilizing moment is $\Sigma Wx$ with partial safety factor is $\gamma_f = 0.9$.
− The overturning moment due to the active earth pressure is $1.1P_1 (H_1/3)$ with adverse partial safety factor $\gamma_f = 1.1$.
− The unfavourable effects of the variable surcharge loading are multiplied by the partial safety factor of $\gamma_f = 1.5$.
− The stabilizing moment from passive earth pressure has been neglected.
− For the wall to satisfy the requirement of stability:

\[
\sum Wx \geq \gamma_f P_1 \left( \frac{H_1}{3} \right)
\]
Stability

- Resistance to sliding
  - Cohesionless soil: The friction $R$ between the base and the soil is $\mu \Sigma M$ where $\mu$ is the coefficient of friction between the base and the soil ($\mu = \tan \theta$). The passive earth force against the front of the wall from a depth $H_2$ soil is:

  $$P_2 = 0.5 \gamma H_2^2 \frac{1 + \sin \varphi}{1 - \sin \varphi}$$

  - Cohesive soils: The adhesion $R$ between the base and the soil is $\beta_b$ where $\beta$ is the adhesion in kN/m$^2$. The passive earth pressure is $P_2 = 0.5 \gamma H_2^2 + 2cH_2$.
  - A nib can be added to increase the resistance to sliding through passive earth pressure.
  - For the wall to be safe against sliding, $1.0 \mu G_k \geq \gamma_f H_k$ where $H_k$ is the horizontal active earth pressure on wall
Reinforcement arrangement:
Reinforcement arrangement:
Example 5.1: Cantilever Retaining Wall
Example 5.1

- Cantilever retaining walls as in Figure 1 support a bank of earth 4.5m height. The soil behind the wall is well-drained sand with the following properties:
  
  - Density, \( \gamma_{\text{soil}} = 2000 \text{ kg/m}^3 = 20 \text{ kN/m}^3 \)
  - Angle of internal friction, \( \phi = 30^\circ \)

The material under the wall has a safe bearing pressure of 110 kN/m\(^2\). The coefficient of friction between the base and the soil is 0.45.

Design the wall using grade 30 concrete and grade 500 reinforcement.
Example 5.1

\[
\begin{align*}
\text{Example 5.1} & \quad \text{Example 5.1} \\
\end{align*}
\]
Example 5.1

- Check wall stability
  Earth pressure, \( \rho = \gamma z \frac{1 - \sin \phi}{1 + \sin \phi} = 20(4.9) \frac{1 - \sin 30}{1 + \sin 30} \)

  \[ = 32.34 \text{kN/m}^2 \]

  For 1m length of wall,
  Horizontal load = \( 0.5 \times (32.34)(4.9) = 79.23 \text{kN} \)

- Maximum soil pressure
  The base properties area = \( 3.4 \times 1 \text{m (width)} = 3.4 \text{ m}^2 \)
  Modulus = \( 3.4^2 / 6 = 1.93 \text{m}^3 \)

  Maximum soil pressure at toe is:

  \[ P_{\text{max}} = \frac{\sum W}{A} + \frac{\sum M}{Z} = \frac{271.4}{3.4} + \frac{129.41 - 91.22}{1.93} = 99.6 \text{kN/m}^2 \]

  \( 99.6 \text{kN/m}^2 < 110 \text{kN/m}^2 \) (OK)
### Example 5.1

<td>91.22</td>
<td></td>
</tr>
</tbody>
</table>
Check stability and overturning

The stability moment about the toe A of the wall for a partial safety factor $\gamma_f = 1.0$ is:

$$91.22 + (271.4 \times 1.7) = 552.6 \text{ kNm}$$

The overturning moment for a partial safety factor $\gamma_f = 1.4$ is:

$$1.4 \times 129.41 = 181.2 \text{ kNm}$$

The stability of the wall is adequate
Example 5.1

- Check resistance to sliding
  
  The forces resisting sliding are the friction under the base and the passive resistance for a depth of earth:

  \[
  P_2 = 0.5 \gamma H_2 \frac{1 + \sin \varphi}{1 - \sin \varphi}
  \]

  \[
  = 0.5 \times 20 \times (0.6)^2 \times 3 = 10.8
  \]

  Friction force = 0.45 \times 271.4 = 122.13kN

  Total friction force = 10.8 + 122.13 = 132.9kN

  Sliding force = 79.23 \times 1.4 = 110.9kN

  The resistance to sliding is satisfactory
Example 5.1

- Wall reinforcement:

  Pressure at the base of the wall,
  \[ \rho = \gamma z \frac{1 - \sin \varphi}{1 + \sin \varphi} = 20(4.5)(0.33) = 29.7 \text{kN/m}^2 \]

  Shear force \[ = 1.35 \left[ 0.5 (29.7)(4.5) \right] = 90.2 \text{kN} \]

  Moment \[ = 90.2 \left[ \frac{1}{3} (4.5) + \frac{1}{2} (0.4) \right] = 153.34 \text{kNm} \]

  Use \( C_{\text{nom}} = 40 \text{mm}; \) \( \varnothing_{\text{bar}} = 20 \text{mm} \)

  \[ d = 400 - 3 - 0.5 (20) = 360 \text{mm} \]

  \[ \frac{M}{bd^2} = \frac{153.34 \times 10^6}{1000(360^2)} = 1.18 < 1.27 \quad \text{Use } Z = 0.95d \]

  \[ A_s = \frac{M}{0.86 f_{yk} Z} = \frac{153.34 \times 10^6}{0.87(500)(0.95 \times 360)} = 1031 \text{mm}^2/\text{m} \]

  Use H20-250 \( (A_s = 1260 \text{mm}^2/\text{m}) \)
Example 5.1

- **Inner footing reinforcement:**
  
  **Shear force,**
  \[
  = 1.35 \left[ 198 + 34 \left( \frac{2.2}{3.4} \right) - (60 \times 2.2) - (0.5 \times 2.2 \times 25.6) \right]
  \]
  
  \[
  = 1.35[198 + 21.1 - 131.4 - 31.1] = 79.56 \text{kN}
  \]

  **Moment,**
  \[
  = 1.35[ (198 + 21.1 - 132)(1.1 + 0.2) - 31.1(0.733 + 0.2) ]
  \]
  
  \[
  = 117.5 \text{ kNm}
  \]

  \[
  \frac{M}{bd^2} = \frac{117.5 \times 10^6}{1000(360^2)} = 0.90 < 1.27 \quad \text{Use } Z=0.95d
  \]

  \[
  A_s = \frac{M}{0.86f_{yk}z} = \frac{117.5 \times 10^6}{0.87(500)(0.95 \times 360)} = 790 \text{mm}^2/\text{m}
  \]

  Use H20-300 \( A_s = 1050 \text{mm}^2/\text{m} \)
Example 5.1

- Outer footing reinforcement:

  Shear force,
  \[
  = 1.35 \left[ (90.3 \times 0.8) + (0.5 \times 0.8 \times 9.3) - 34 \left( \frac{0.8}{3.4} \right) \right] \\
  = 1.35[72.2 + 3.72 - 7.7] = 92.10 \text{kN}
  \]

  Moment,
  \[
  = 1.35\left[ (72.2 - 7.2)(0.4 + 0.2) + 3.72(2/3(0.8) + 0.2) \right] \\
  = 68.4 \text{kNm}
  \]

  \[
  \frac{M}{bd^2} = \frac{68.4 \times 10^6}{1000(360^2)} = 0.52 < 1.27 \quad \text{Use } Z=0.95d
  \]

  \[
  A_s = \frac{M}{0.86f_{yk}Z} = \frac{68.4 \times 10^6}{0.87(500)(0.95 \times 360)} = 457 \text{mm}^2/\text{m}
  \]

  Use H16-300 \( (A_s = 670 \text{mm}^2/\text{m}) \)
Example 5.2:
Cantilever Retaining Wall
(Include Surcharge Loading)
Example 5.2

- Design a cantilever retaining wall to support a bank of earth 3.5m height. The top surface is horizontal behind the wall but it is subjected to a dead load surcharge in 15 kN/m². The soil behind the wall is well-drained sand with the following properties:

  - Density, \( \gamma_{soil} = 1800 \text{ kg/m}^3 = 18 \text{ kN/m}^3 \)
  - Angle of internal friction, \( \varphi = 30^\circ \)

The material under the wall has a safe bearing pressure of 100 kN/m². The coefficient of friction between the base and the soil is 0.50.

Design the wall using grade C30 concrete and grade 500 reinforcement.
Example 5.2
Example 5.2

- Check wall stability
  Consider 1m length of the wall. The surcharge is equivalent to an additional height of $15 \text{kN/m}^2 / 18 \text{kNm}^3 = 0.85$.
  Therefore, total height of the soil = $3.5 + 0.25 + 0.85 = 4.6 \text{m}$

  Earth pressure,
  \[
  \rho = \gamma z \frac{1 - \sin \phi}{1 + \sin \phi} = 20(z) \frac{1 - \sin 30}{1 + \sin 30} \\
  = 17.6(z)(0.333) = 5.87 \text{zkN/m}^2
  \]

  At $z= 0.85 \text{m}$, $\rho= 5 \text{kN/m}^2$
  At $z = 4.6 \text{m}$, $\rho=27 \text{kN/m}^2$

- Maximum soil pressure
  The base properties area = $2.85 \times 1 \text{m (width)} = 2.85 \text{ m}^2$
  Modulus = $2.85^2 / 6 = 1.35 \text{m}^3$

<td>14.18</td>
</tr>
<tr>
<td>Total</td>
<td>181.29</td>
<td></td>
<td>59.59</td>
</tr>
</tbody>
</table>
Example 5.2

Maximum soil pressure at service load:

\[ P_{\text{max}} = \frac{\Sigma W}{A} + \frac{\Sigma M}{Z} = \frac{181.29}{2.85} + \frac{86.67 - 59.59}{1.35} = 83.76 \text{kN/m}^2 \]

83.76 \text{kN/m}^2 < 110 \text{kN/m}^2 \quad \text{(OK)}

- Check stability and overturning
  The stability moment about the toe A of the wall for a partial safety factor \( \gamma_f = 0.9 \) is:

\[ 59.59 + [181.29 \times (2.85/2)] = 317.9 \times 0.9 = 286.11 \text{kNm} \]

The overturning moment for a partial safety factor \( \gamma_f = 1.1 \) is:

\[ 1.1 \times 86.64 = 95.3 \text{kNm} \]

The stability of the wall is adequate
Example 5.1

- Check resistance to sliding

The forces resisting sliding are the friction under the base and the passive resistance for a depth of earth of 850 mm to the top of the base.

Passive force,

\[ P_2 = 0.5 \gamma H_2^2 \frac{1 + \sin \phi}{1 - \sin \phi} \]

\[ = 0.5(18)(0.85)^2(3) = 19.51 \]

Friction force = 0.45 x 181.29 = 81.58kN

Total friction force = 19.51 + 81.85 = 101.36kN

Sliding force = 1.4 x 59.98 = 83.97kN

The resistance to sliding is satisfactory
